

We have MVP!!

We have: user login/register, cookies, session

We have: modifying preferences and availability

We have: searching for suggested roommates, ignores unavailable users, somewhat naive algorithm for preference matching and sorting

- only show users that have at least some overlap in their yes/don't care vs no dorm preferences
- uses weighted hamming distance for all preferences to determine percentage match

We have: requesting roommates, accepting/denying/cancelling the request, becoming roommates (can only have 1 roommate right now), deleting roommates.

Login only allows MIT emails (maybe send confirmation email?)
